Solution for connecting Jetson-Nano to Pixhawk: (*thanks to all who pitched in and a special thanks to ppoirier*)

Result : Propeller rotated as programmed in simple_goto.py

Main issue: Firmware on Pixhawk required upgrade, this was suggested by "**ppoirier**" on ardupilot discussion forum (https://discuss.ardupilot.org/t/nvidia-jetson-nano-for-pixhawk/46052/30)

Suggestion: Upgraded from **Autopilot Firmware version: APM:Copter-3.4.6 to Autopilot Firmware version: APM:Copter-4.0.1.**

mtbsteve mentioned https://github.com/mtbsteve/redtail is up and running along with a full implementation of the original Redtail project on Arducopter plus a bunch of enhancements. https://discuss.ardupilot.org/t/nvidia-jetson-nano-for-pixhawk/46052/32

Jetson-nano-j41 and Pixhawk Telem2 connection details:

Jetson -nano j-41 power pin (#2 or 4) is not connected to Pixhawk (pin 1) .

Following are my connection details :

1. GND jetson-nano (pin #4) is connected to GND of Pixhawk (6th pin)
2. TX of jetson nano (8th pin) is connected to RX of Pixhawk(3rd pin)
3. RX of jestson nano (10th pin) is connected to TX of Pixhawk (2nd pin)

How to upgrade **Autopilot Firmware :**

1. **First use MissionPlanner to update firmware (**https://ardupilot.org/planner/docs/common-loading-firmware-onto-pixhawk.html**)**
2. **Next recalibrate Accel Calibration and Compass, for this I used QGroundControl**

   Following are the steps to configure QGroundControl
   https://docs.qgroundcontrol.com/en/getting_started/download_and_install.html

   sudo usermod -a -G dialout $USER
   sudo apt-get remove modemmanager -y
   sudo apt install gstreamer1.0-plugins-bad gstreamer1.0-libav -y
   Download https://s3-us-west-2.amazonaws.com/qgroundcontrol/latest/QGroundControl.AppImage

   chmod +x ./QGroundControl.AppImage
   ./QGroundControl.AppImage (or double click)

   perform calibration mainly the
   1. Accel Calibration
   2. Compass calibration (preferablly sitting outside)

Two tests performed and both achieved satisfactory results:

Test1: vehicle_state.py (https://github.com/dronekit/dronekit-python/tree/master/examples/vehicle_state)

Customization on vehicle_state.py , I have hardcoded the parameters for connection_string
#vehicle = connect(connection_string, wait_ready=True)
vehicle = connect('/dev/ttyTHS1', wait_ready=True, baud=57600)

output of Test1:
Connecting to vehicle on: <dronekit.Vehicle object at 0x7f835e9240>
CRITICAL:autopilot:PreArm: GPS glitching

Get all vehicle attribute values:
Autopilot Firmware version: APM:Copter-4.0.1
Major version number: 4
Minor version number: 0
Patch version number: 1
Release type: rc

Release version: 0
Stable release?: True
Autopilot capabilities
Supports MISSION_FLOAT message type: True
Supports PARAM_FLOAT message type: True
Supports MISSION_INT message type: True
Supports COMMAND_INT message type: True
Supports PARAM_UNION message type: False
Supports ftp for file transfers: True
Supports commanding attitude offboard: True
Supports commanding position and velocity targets in local NED frame: True
Supports set position + velocity targets in global scaled integers: True
Supports terrain protocol / data handling: True
Supports direct actuator control: False
Supports the flight termination command: True
Supports mission_float message type: True
Supports onboard compass calibration: True
